This study focuses on the preparation, characterization and the optical properties of a 8-(2-amino-2-phenyl-acetyl)a mino-4-chloro-7-oxo- 6-azabicyclo[4.2.0] oct-4-ene-5-carboxylic acidligand and its  $Zn^{2+}$ ,  $Cd^{2+}$ ,  $Ni^{2+}$ ,  $Pd^{2+}$  and  $Pt^{2+}$  complexes. The 8-(2-amino-2-phenyl-acetyl)a mino-4-chloro-7-oxo- 6-azabicyclo[4.2.0] oct-4-ene-5-carboxylic acid ligand and the resulting metal complexes gave an intense emission (where  $\lambda_{max} = 376$  nm) upon irradiation by Ultra-Violet light. The photoluminescence quantum yields and long excited-state lifetimes of the ligand and its complexes were calculated. The 8-(2-amino-2-phenyl-acetyl)a mino-4-chloro-7-oxo- 6-azabicyclo[4.2.0] oct-4-ene-5-carboxylic acid ligand has a photoluminescence quantum yield of 52% and long excited-state lifetime of 4.88 ns. The photoluminescence intensities and quantum yields of the metal complexes dramatically reduced with respect to that of the 8-(2-amino-2-phenyl-acetyl)a mino-4-chloro-7-oxo- 6-azabicyclo[4.2.0] oct-4-ene-5-carboxylic acid ligand upon complexation with various metals. This novel compound and its complexes are of interest as organic emitting material for electroluminescent devices.
